

Humidity Indicator Cards

Keeping moisture under control

Brownell Limited humidity indicator cards are produced from a specific blotting paper. Which is impregnated with either a cobalt chloride solution or a cobalt bromide solution. The type of solution used depends upon the desired *relative humidity* values required for the card to indicate at. We can produce indicator cards for values between 10% to 70% relative humidity. There is also the option of having *multi level* indicator cards.

The indicator cards work on the principle that they will change colour from **blue** to **pink** at whatever relative humidity value they are impregnated for at a temperature of 23°C. It should only be necessary to replace these items if they become contaminated.
